

November 2022

Dear Customer

## MKS TECHNICAL BULLETIN:

### Specification change of BM-7 copper plated plate

- The surface treatment of the aluminum side plates used for BM-7 Copper will be changed.
- The conventional copper plating and clear coat treatment will be replaced by copper-colored anodization (right photo). The conventional glossy look is gone, and the color is more subdued.
- Anodization, also known as anodic oxidation treatment, is a surface treatment in which an oxide film is generated on the surface of aluminum by electrolytic treatment with an anode. It contributes to corrosion and wear resistance.
- As soon as the stock of the old specification runs out, the changeover will be applied as a running change. Each supplier will be notified individually at the time of shipment when the changeover will be applied.
